

System performance:

Object location – Dergachi city, Kharkov region (MSW landfill); Flow of: 170 m³/day

Climatic modification U1 (Moderate climate -40 ... + 40 ° C)

Estimated seismicity of the construction object in points of the scale MSK-64 is 5 points

Snow load 160kg / m²

Wind load 43kg / m²

No	Name	Data
1	Capacity	170 m ³ /day
2	Power	70 kW-400V/50Hz
3	Space Requirement	40 ft. Container
4	Feed	170 m ³ /day
5	Reject	67 m ³ /day
6	Filtrate	103 m ³ /day
7	Recovery	75%

The treatment plant is based on the reverse osmosis process with a capacity of up to 170 m³/day.

The task is to remove excess organic and mineral substances (heavy metals, chlorides, sulphates and other dissolved salts), as well as partial disinfection of wastewater. The module is supplied in container version - ISO 40 ft. (12x2.5x2.5), fully automated (based on SIEMENS controllers), and equipped with lighting, air conditioning, adapted to weather conditions in Ukraine.

The estimated electrical conductivity for raw/untreated wastewater is about 15,000 µS/cm (at 25°C).

The estimated degree of leachate treatment is about 75%.

The proposed system consists of membrane modules, which, due to their design, are aimed at cleaning waters with a high pollution index, such as the leachate of solid waste landfill.

The proposed system consists of membrane modules, which, due to their design, are aimed at cleaning waters with a high pollution index, such as the leachate of solid waste landfill.

Advantages over other membrane plants:

- Create a circular flow on the surface of each membrane. The permeate passes into the common central channel while the concentrate flow as a result falls on the next membrane in turn, etc;
- Can be used at pressures up to 140 bar, which allows wastewater treating with a high percentage;
- Have a self-generation system, which ensures a long and effective service life for membranes;
- Has a modular layout that simplifies maintenance, repair and replacement of membrane modules;
- Has a low-pressure drop across the membranes, so the operating flow is lower than that of competing systems.

Typically, energy savings is of 5-8 kW per m³ of liquid;

- Specially designed for landfill leachate and high quality permeate.

The developed facility of membrane reactors consists of the following elements:

- Installation of reverse osmosis;
- Drain/leachate tank;
- Degasser of permeate;
- Antiscalant dosing station;
- Alkaline cleaning dosing station;

- Acid-cleaning dosing station;
- Monitoring system based on the Siemens controller.
- Installation of reverse osmosis of the second stage.

The proposed technology will allow to treat leachate to the normative requirements of wastewater quality before discharging it into the city wastewater system in Kharkov or to use it for technical purposes (irrigation of the landfill in arid months, technical water for the needs of the Complex).

When wastewater treatment (MSW leachate), two wastewater flows are formed:

- Permeate - conditionally clean wastewater,
- Concentrate - a solution of suspended contaminants.

Influent concentration for design:

Parameter	Value	Unit	Remark
Temperature	5-20	°C	
Calcium, Ca	170	mg/dm ³	1
Magnesium, Mg	40	mg/dm ³	
Sodium, Na	3700	mg/dm ³	1
Bicarbonate HCO ₃	1700	mg/dm ³	1
pH	8,0	(unit)	
CCO	14000	mg/dm ³	
BOD ₅	6000	mg/dm ³	
Ammonium nitrogen	1500	mg/dm ³	
Nitrite	3,9	mg/dm ³	
Nitrates	50	mg/dm ³	
Phosphates	111	mg/dm ³	
Chlorides	3500	mg/dm ³	
Sulphates	500	mg/dm ³	
Total iron	70	mg/dm ³	2
Copper	1,4	mg/dm ³	
Chrome ³⁺	3,0	mg/dm ³	
Synthetic surfactants	5,7	mg/dm ³	
Phenol	5,2	mg/dm ³	
Oil	7,0	mg/dm ³	3
Zinc	4,0	mg/dm ³	
Nickel	1,5	mg/dm ³	
Dry residue	15000	mg/dm ³	

Remarks:

- 1- Pretreatment has to reduce Ca/Mg content to make sure that cleaning frequencies are not too high.
- 2- Pretreatment has to reduce iron content. The original iron potential produces a lot of cleaning frequencies.
- 3- Pretreatment has to reduce oil content. For prevent to blockages of RO membrane

Requirement of filtrate quality:

Parameter	Value	Unit

RO-1 Membrane:

industrial RO series

industrial high pressure brackish water RO elements

The S-Series proprietary thin-film reverse osmosis membrane is used in the Industrial RO3 elements. It is characterized by high sodium chloride rejection and a smooth, fouling-resistant membrane surface.

The A-Series proprietary thin-film reverse osmosis membrane is used in the Industrial RO5 and RO6 elements. It is characterized by high sodium chloride rejection and a high permeability.

Industrial RO Brackish Water Elements are used for concentration of wastewater streams with a high osmotic pressure or a high level of solids. They can also be used to concentrate diluted acids.

These elements feature a 35mil or 50mil spacer in a high pressure compatible element assembly.

Table 1: Element Specification

Membrane	S-Series, Thin-film membrane (TFM*) A-Series, Thin-film membrane (TFM*)
----------	--

Model	Average permeate flow gpd (m ³ /day) ^{1,2}	Average NaCl rejection ^{1,2}	Minimum NaCl rejection ^{1,2}
INDUSTRIAL RO3 4040F35	1,900 [7.2]	99.0%	98.5%

RO-2 Membrane:

AE HR Series

High Rejection Low Energy Seawater RO Elements

The AE HR series of proprietary thin film reverse osmosis membrane elements are characterized by an excellent sodium chloride rejection. AE HR series is selected when high quality permeate is demanded from seawater that is relatively high in TDS.

AE HR series new membrane chemistry provides excellent rejection characteristics when operated at seawater operating conditions (pressures exceeding 800psi (5,516kPa).

Table 1: Element Specification

Membrane	Thin-film membrane (TFM*)			
Model	Average permeate flow gpd (m ³ /day) ^{1,2}	Average NaCl rejection ^{1,2}	Minimum NaCl rejection ^{1,2}	Minimum Boron Rejection ²
AE-90	2000 (7.6)	99.8%	99.3%	90.0%

Table 2: Operating and CIP parameters

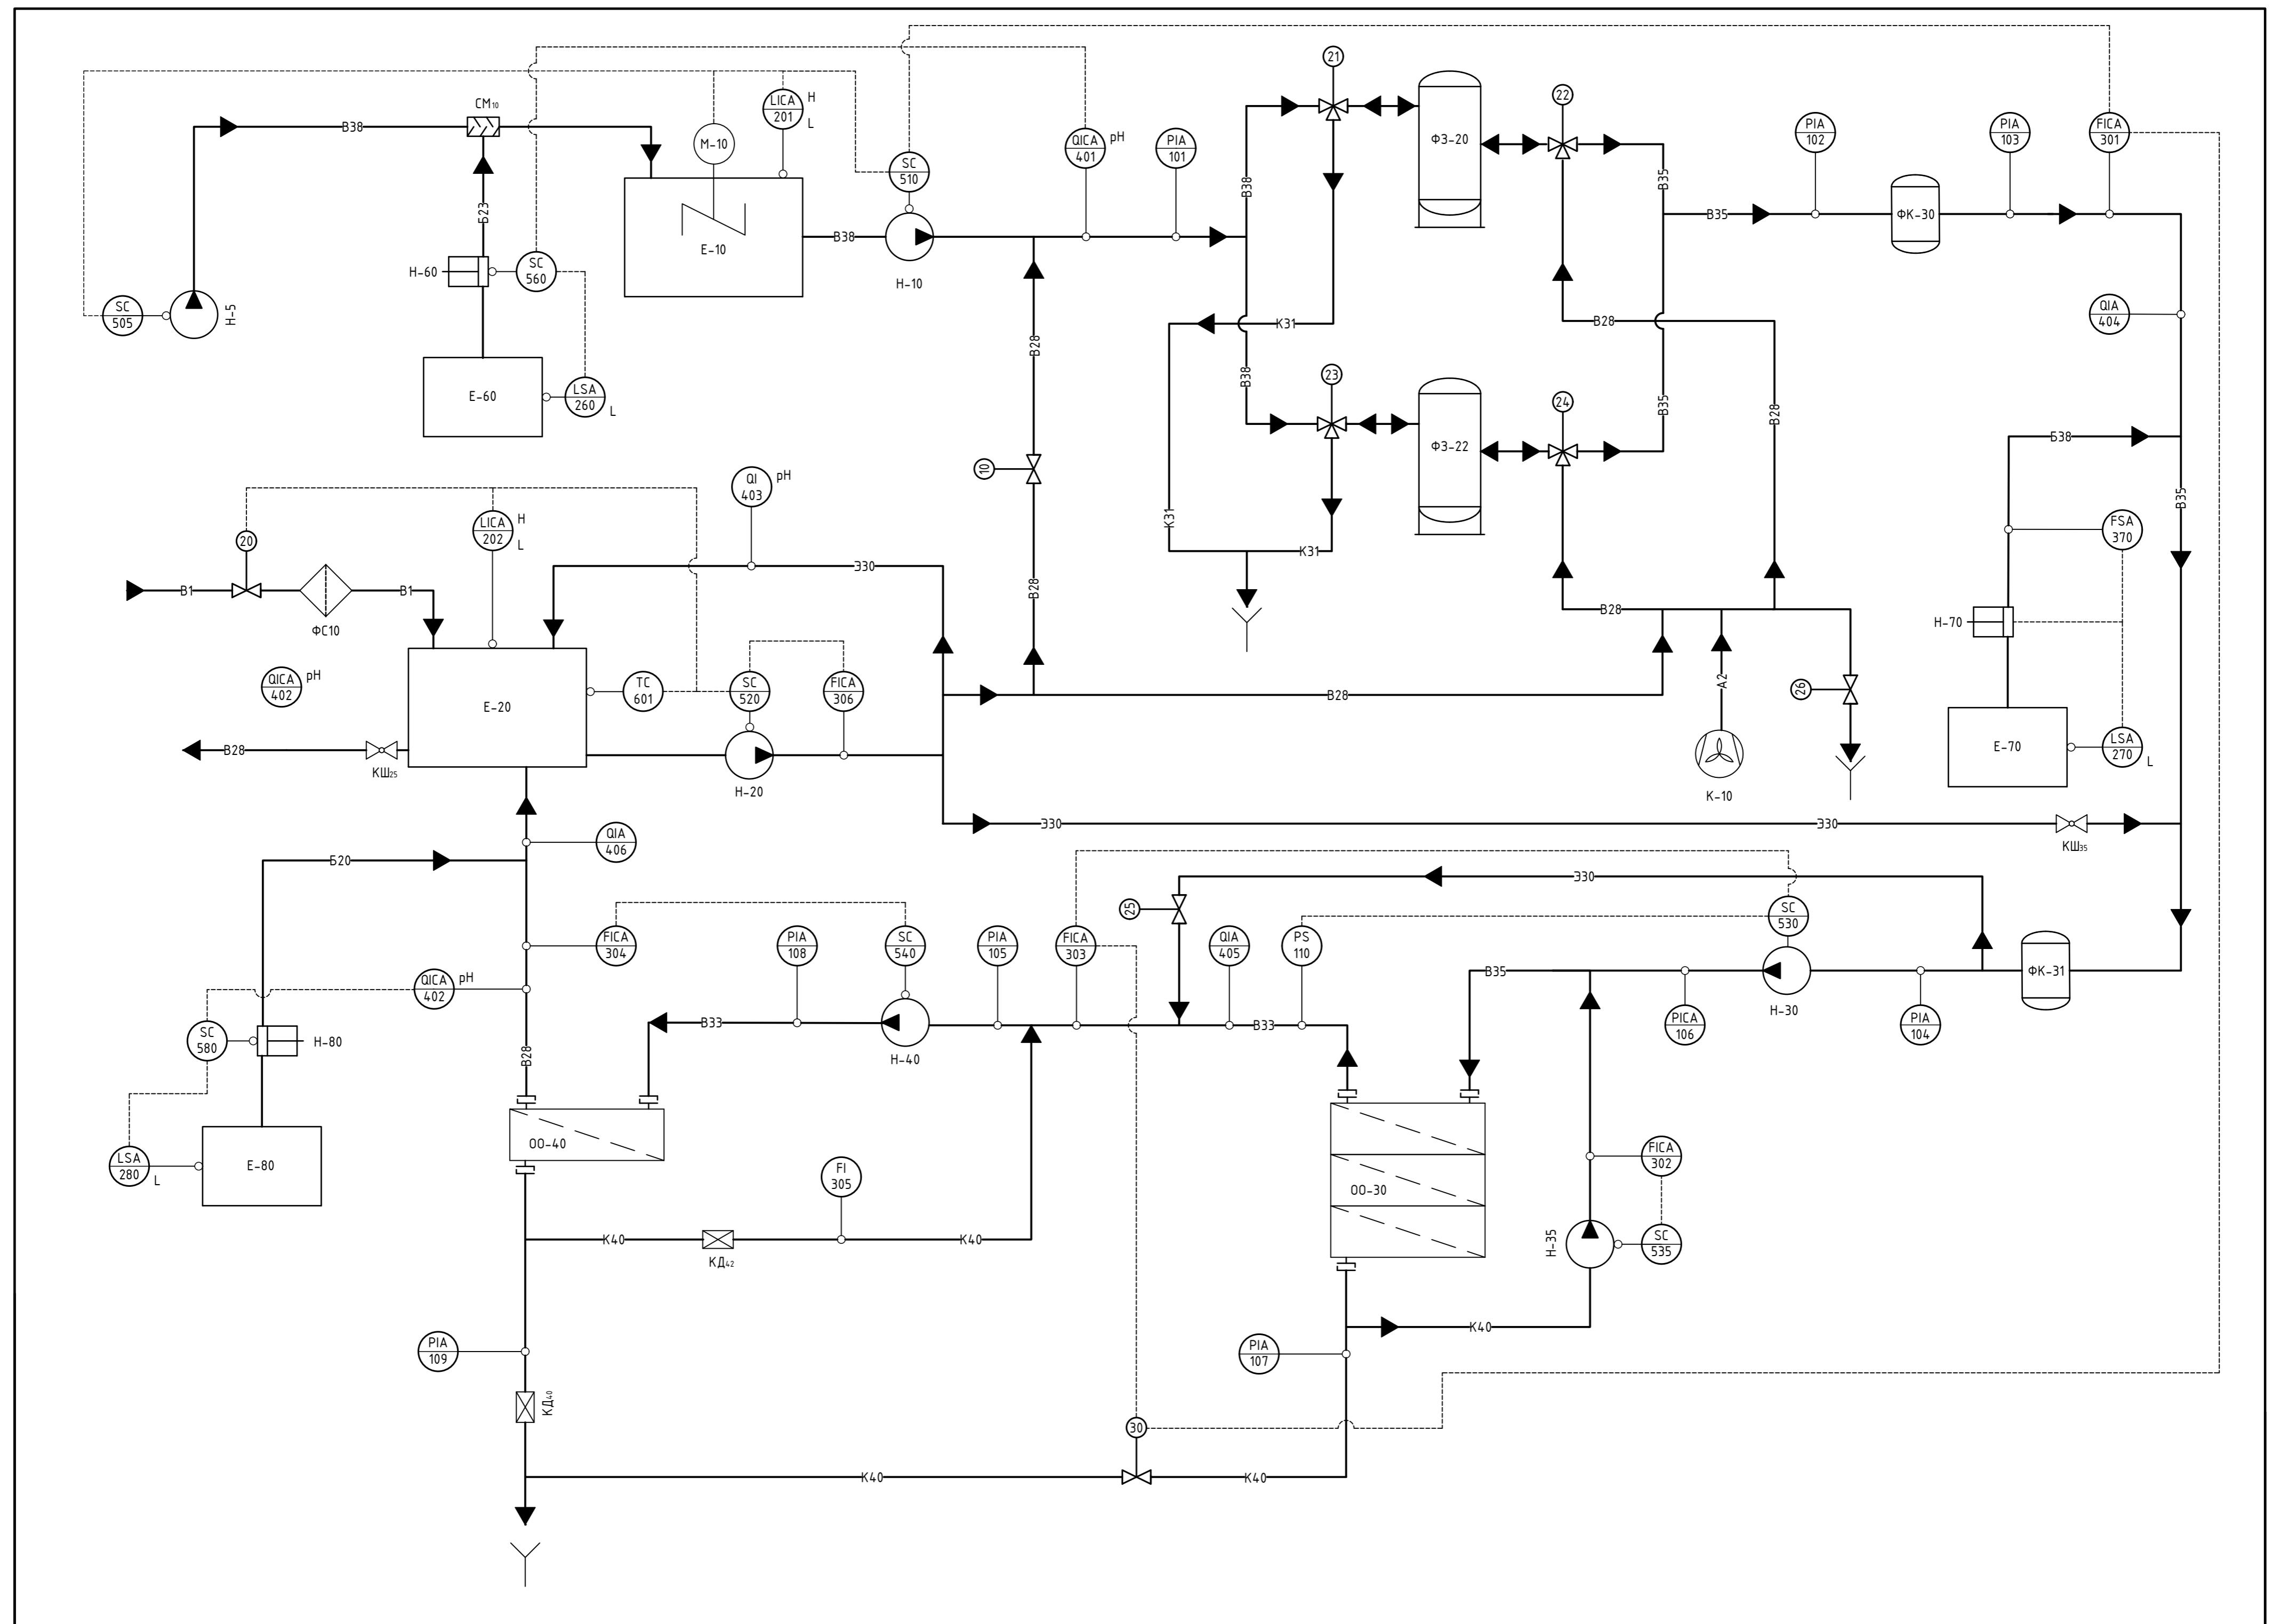

Typical Operating Pressure	800psi (5,516kPa)
Typical Operating Flux	7-11GFD (12-19LMH)
Maximum Operating Pressure	1,200psi (8,274kPa)
Maximum Temperature	Continuous operation: 122°F (50°C) Clean-In-Place (CIP): 122°F (50°C)
pH range	Optimum rejection pH: 7.0-7.5, Continuous operation: 4.0-11.0, Clean-In-Place (CIP): 2.0-11.5
Maximum Pressure Drop	Over an element: 12 psi (83 kPa) Per housing: 50 psi (345 kPa)
Chlorine Tolerance	1,000+ ppm-hours, dechlorination recommended
Feedwater ³	NTU < 1 SDI < 5

³SDI is measured on a non-linear scale using a 0.45 micron filter paper. Additionally, finer colloids, particulates and microorganisms that pass through the filter paper and not measured in the SDI test, will potentially foul the RO element. For performance consistency and project warranty, please use Winflows projection software and consult your Filters with Membranes representative.

Table 3: Dimensions and Weights
